Cloud Backups

Try a little 'blue sky-thinking' to find the most effective way to back-up your data - let Venom IT guide you through how to protect your critical data with the Cloud.

We'll backup your data and formulate a business continuity plan to protect your files

Data protection is one of the major issues small- to medium-sized businesses face, yet many don't apply the necessary improvements to guarantee the protection of their crucial files.

Many Business owners fail to see the benefits of off-site backups and resort to backing up their data using direct-attached storage, believing these will make them less vulnerable to problems.

However, issues such as hardware and software failure, hacking, viruses and staff errors all result in critical data loss which can be catastrophic for your business. It is therefore vital that you protect your data and your business with an encrypted cloud backup service.

Although on-site backups are still helpful, you have to consider potential risks and mishaps that could possibly transpire in your office. Take into consideration that hard drives wear out and PCs crash -accidents are a fact of life.

When you use an off-site backup, you are saving your files securely in the Cloud. Venom IT will back-up your data and formulate a business continuity plan to solidify your strategies.

We will consider all the parameters; from the number of users to the appropriate storage. this will enable us to efficiently come up with the necessary backup strategies for your Business.

Let Venom IT take the stress away from backing up your data with our encrypted cloud backup service and secure your Business today.
